Super Girl Time. Ultimate Week of Summer School. Beauty and the Beast 5. I am glad to provide you the following guides for free. Bigsoft WebM Converter V3.7.6.4626 With Key [iahq76] Serial Key Keygen kirkkdev. It just take a moment. Our web host slowlab. Everything was working fine but last week I reuploaded the file. Thank you to everyone for downloading, using and reviewing my software. Bigsoft WebM Converter V3.7.6.4626 With Key [iahq76] Serial Key Keygen kirkkdev. The invention relates to an optical detector for detecting a beam of light, in particular a light beam in the visible light range, which is provided with a radiation-sensitive layer on a substrate. Such an optical detector is known, for example, from U.S. Pat. No. 5,577,496. In that case, a substrate has a first surface and a second surface. The radiation-sensitive layer, which is formed as a semiconductor layer, is applied to the second surface. An optical detector of the type under discussion is configured, for example, as a digital still camera. In that case, the radiation-sensitive layer is applied to the second surface of a silicon substrate. The substrate comprises an epitaxial layer of silicon which is applied to the second surface, for example by wafer bonding. In that case, the epitaxial layer is composed of silicon, which has a smaller coefficient of expansion than silicon. As a result, the silicon substrate can compensate for any expansion of the epitaxial layer, which occurs when the silicon substrate expands due to a temperature change. As a result of the application of the radiation-sensitive layer, the coating of the radiation-sensitive layer has different coefficients of expansion than the substrate. As a result, the radiation-sensitive layer is subject to increased stresses. A greater stress means a lower resistance to mechanical strain and the radiation-sensitive layer is thus subject to increased mechanical strain. As a result, there is a risk of a defect of the radiation-sensitive layer occurring, for example, due to a crack. The object of the present invention is to provide an optical detector of the type under discussion in which the radiation-sensitive layer is not subject to increased stresses. In accordance with the present invention, this is achieved in that the radiation-sensitive layer comprises a first layer which is applied 82157476af
